

So ... compared to the averages listed in the file, your test scores are a lot lower than your quiz scores. This is not a tough one to figure out for most kids. Since a quiz covers a lot less than a test, some kids who don't spend time studying for either one tend to be able to have a better time fighting their way through a quiz than a test.

Are you studying for those things? Your scores indicate that you're dropping more in the time between quizzes and tests than other kids who get the same grade you earned. A few minutes of study a day should make a big difference. It's the difference between hoping that you remember what you learned a few days ago, and knowing that you're ready to show what you've been practicing since then. Just like playing the piano or beating a video game, practicing every day forms good habits. I bet if you'd study more, you'll see both grades go up.

Remember, this is just a guess about your status based on what has been true of a majority of kids in the past with the same combination of scores as yours. There could definitely be other reasons why your scores are in this combination. If you feel like you need to investigate it further, Rice would love to help you do that.
